- Project no. 1: Duck Rescue

Duck Rescue

Aug 25-Sept 4

The challenge of this project was to rescue as many ducks as we could from three feet away, using a device constructed with limited materials under two minutes. We built a net with handles at the corners to lift up the ducks from below. This would cover a large amount of space. While we built the contraption, it did not work at all at first. Modifications were made and it was able to 'rescue' some ducks.

This first artifact shows our final sketch. I am proud of this because it is our proud design before we started prototyping.

The second artifact shows our first prototype for the design. While it didn't work the first time, I'm still proud of it for being an accurate prototype of our sketch, given the limited materials.

This third artifact is our final design, after our revision from the first test it worked to retrieve ducks. This is also why I'm proud of it.
